# CHAT

A question
worth answering

# CLARITY

Work someone
can start

# LOOM

## Catch work before it falls through the cracks

## ANALYTICS REQUESTS, ONE WORKSPACE

The Work Behind the Work / Local prototype

# THE WORK BEFORE THE ANALYSIS

## REQUESTERS

Ask in chat.
Wait for updates.
Repeat the context.

## ANALYSTS

Chase dates, datasets, and metric definitions before they can start.

## TEAM LEADS

Need clear ownership and a view of where requests are waiting.

**The request exists. The requirements and responsibility are scattered.**

# ONE MESSAGE. SEVERAL MISSING DECISIONS.

**“Can the analytics team investigate why sales dropped last week?”**

“We need a breakdown by region and product before Monday’s leadership meeting.”

## MISSING

Exact dates
Comparison period
Dataset
Sales definition
Owner + deadline

**An imported request is the beginning of the workflow, not the finished brief.**

# THE LOOM WORKFLOW

## CAPTURE

Import the chat ask and its source link.

## CLARIFY

Identify missing context; ask for it.

## REVIEW

Show exact changes for human approval.

## TRACK

Assign ownership and measure flow.

**The assistant proposes. Your team decides.**

# A REQUEST READY FOR AN ANALYST

## BEFORE

"Last week"
No dataset
Undefined sales
Unassigned

| | |
|---|---|
| **PERIOD** | Oct 19–25 vs. Oct 12–18, 2026 |
| **METRIC** | Net sales after discounts/refunds; excluding tax |
| **DATASET** | Synthetic orders and refunds |
| **OUTPUT** | Region/product breakdown for leadership |

**Review → approve → assign an existing member → set a concrete deadline**

# EXASOL MEASURES THE WORKFLOW

## STAGE TIME

Median and p90 calendar time in each workflow stage.

## WEEKLY FLOW

Arrivals, closures, reopenings, and backlog movement.

## OWNERSHIP

Open and overdue requests, age buckets, and oldest work.

**SQL-derived measurements with query evidence; not LLM estimates.**

Waiting time is not effort. Open workload is not available capacity.

# KNOWLEDGE PREVENTS REPEATED CLARIFICATION

## NET SALES

Sales after discounts and refunds, excluding tax.

## SAVE

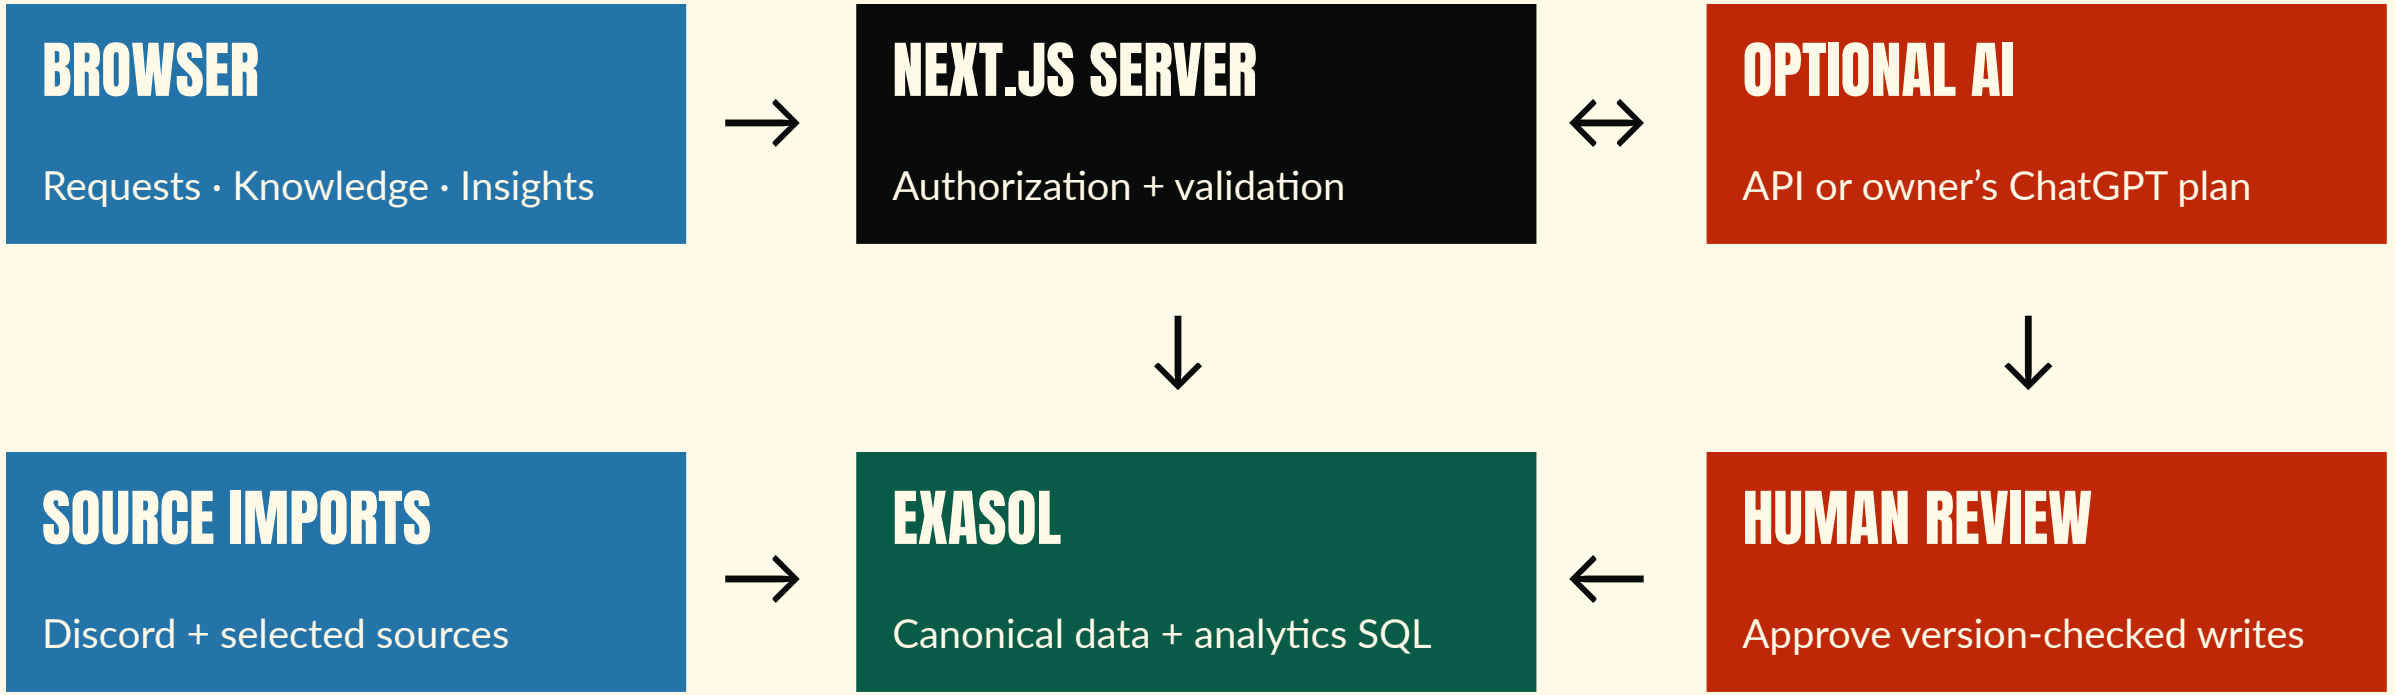

An owner approves a shared definition.

## REUSE

The assistant retrieves relevant guidance and cites the saved source.

**One clarification can become shared context for the next request.**

# SYSTEM ARCHITECTURE

**One local server. Real Exasol persistence. No automatic application of AI changes.**

# WHAT THE PROTOTYPE DEMONSTRATES

## IMPLEMENTED

Chat intake + manual request work
Reviewed assistant proposals
Roles, activity, and persistence
Knowledge + Exasol insights

## NOT CLAIMED

Automated business analysis
Proven productivity gains
Hosted production readiness
Universal live connector coverage

**Public or synthetic data for the demonstration. Human review remains required.**

# NEXT: MEASURE THE COORDINATION COST

## COMPARE

Ordinary chat
Loom, manual
Loom + assistant

## MEASURE

Clarification rounds
Time until Ready and assigned
Review effort and incorrect changes
Repeated questions

**Evaluate outcomes before claiming time savings or customer traction.**

# MAKE THE NEXT REQUEST EASIER TO START

## “CAN SOMEONE LOOK INTO THIS?”

A clear question. An owner. A next step.
